

### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application.

#### **Listing of Claims:**

Claim 1 (Currently Amended): A method comprising ~~steps of:~~  
establishing a plurality of queue execution modes by assigning a unique set of tag values for each of the plurality of queue execution modes; and

- (a) assigning a different unique tag for each of several data access commands, wherein, for each of several data access commands, the assigned unique tag is selected from among the tag values assigned to the plurality of queue execution modes; and
- (b) ~~designating which of a plurality of queue execution modes to use for a selected one of the data access commands based on the selected command's tag.~~

Claim 2 (Currently Amended): The method of claim 1, further comprising ~~steps of:~~

- (e) associating at least two of the data access commands with only one of the queue execution modes; and
- (d) executing the two commands in an order that is partially based on an estimated seek length for each of the two commands.

Claim 3 (Currently Amended): The method of claim 1, ~~further comprising a step of:~~  
establishing wherein at least one of the unique sets of tag values consists of a contiguous range of tag values, tags that includes the selected command's tag, the contiguous range corresponding to the mode to be designated in the designating step (b).

Claim 4 (Currently Amended): The method of claim 1, further comprising ~~steps of:~~

- (e) holding a sector identifier of the data access command in a task file register; and
- (d) transferring a data block corresponding to the sector identifier through a transducer adjacent to a data storage disc.

Claim 5 (Currently Amended): The method of claim 1, further comprising ~~steps of:~~  
(e) associating one of the queue execution modes with a first queue;  
(d) associating another of the queue execution modes with a second queue; and  
(e) performing an operation that affects at least one command in the first queue without affecting a command that is in the second queue.

Claim 6 (Currently Amended): The method of claim 1, wherein the plurality of queue execution modes includes an abort handling queue, further comprising ~~a step (e) of determining whether to aborting~~ a pending data access command based on a newly-received command having a tag assigned to the abort handling queue.

Claim 7 (Currently Amended): The method of claim 1, further comprising ~~a step (e) of~~ redefining a queue execution mode that is associated with at least one tag while the at least one tag is not assigned to any data access command.

Claim 8 (Currently Amended): The method of claim 1, ~~in which the designating step (b) includes a step (b1) of determining which of~~ wherein the queue execution modes include a plurality of error correction modes to use for the selected data access command.

Claim 9 (Currently Amended): The method of claim 1, further comprising ~~a step (e) of~~ using at least one of the queue execution modes to transfer video data through a transducer adjacent to a data storage disc.

Claim 10 (Currently Amended): The method of claim 9, wherein the queue execution modes include a sequential delivery mode, wherein a data access command regarding the video data is assigned a tag associated with the sequential delivery mode, the method further comprising in ~~which the designating step (b) includes a step (b1) of determining whether to use a~~ using the sequential delivery mode for the selected data access command regarding the video data.

Claim 11 (Currently Amended): The method of claim 1, wherein the queue execution modes include in which the designating step (b) includes a step (b1) of determining whether to use a sequential delivery mode for the selected data access command.

Claim 12 (Previously Presented): The method of claim 1 in which a triggered operation is performed on an in-store one of the commands if an in-progress one of the commands is associated with a predetermined trigger tag, and otherwise the triggered operation is generally not performed on the in-store one of the commands.

Claim 13 (Currently Amended): The method of claim 1 further comprising in which the designating step (b) includes a step (b1) of establishing the designated queue execution mode wherein the plurality of queue execution modes includes a queue execution mode so that provides that an error is reported if the selected a command associated with a tag assigned to the queue execution mode is not completed within a predetermined interval, and otherwise the error is generally not reported.

Claim 14 (Currently Amended): The method of claim 1 in which the assigning a unique tag for each of several data access commands step (a) comprises steps of:

- (a1) assigning a first one of the tags to a first-received one of the commands;
- (a2) while the received command is still pending, assigning a second one of the tags to a second-received one of the commands;
- (a3) while the received commands are both still pending, assigning a third one of the tags to a third-received one of the commands; and
- (a4) after the assigning steps (a1) – (a3) are completed, completing the first-, second- and third-received commands.

Claim 15 (Currently Amended): The method of claim 14 in which the assigning a unique tag for each of several data access commands step (a) further comprises a step (a5) of assigning a fourth one of the tags to a fourth-received one of the commands while the third-received command is still pending.

Claim 16 (Previously Presented): A method comprising steps of:

- (a) defining an available set of modes to comprise a standard mode and a video mode, the standard mode associated with a standard queue and configured to use a standard error correction process, the video mode associated with a non-standard queue and not configured to use the standard error correction process;
- (b) assigning a sequential delivery queue tag to a first-received command, the first-received command being a video data transfer command;
- (c) assigning a first standard queue tag to a second-received command while the first-received command is still pending, the second-received command being a standard read command;
- (d) assigning a second standard queue tag to a third-received command while the first- and second-received commands are both still pending, the third-received command being a standard write command;
- (e) assigning another tag to a fourth-received command while the third-received command is still pending;
- (f) designating one of the available set of modes for each of the received commands based on the command's tag; and
- (g) after the assigning steps (b)-(e) and the designating step (f) are completed, completing the received commands.

Claim 17 (Original): The method of claim 16 in which the completing step (g) is performed by steps comprising:

- (g1) using the video mode to transfer data through a transducer at a disc location identified by the sector address associated with the first-received command; and
- (g2) using the standard mode and the sector addresses associated with the standard commands, executing the standard commands in a sequence that is partially based on an estimated seek length for each of the standard commands.

Claim 18 (Previously Presented): An electromechanical device comprising:  
one or more data storage disc(s);  
a memory configured to hold several pending commands for accessing the disc(s), each of the commands having a unique tag; and  
a controller configured to determine which of a plurality of queue execution modes to use for a selected one of the pending commands based on the selected command's tag.

Claim 19 (Original): The electromechanical device of claim 18 in which the memory is configured to hold the tag as a binary value no larger than one byte.

Claim 20 (Original): The electromechanical device of claim 18, further including an actuator having a nominal seek time longer than 1 millisecond.

Claim 21 (Original): The electromechanical device of claim 18 in which the memory includes a multiple-bit state register configured to identify one or more other tags that are available for a future command.

Claim 22 (Original): The electromechanical device of claim 18 in which the queue execution modes include a higher-priority mode associated with a first queue and a lower-priority mode associated with a second queue.

Claim 23 (Original): The electromechanical device of claim 22 in which the first queue is associated with a total of M tags, in which the second mode is associated with a total of N tags, and in which  $N > 0$  and  $M > 0$ .

Claim 24 (Original): The electromechanical device of claim 18 in which the controller is operatively coupled to communicate with a host through a serial ATA bus.

Claim 25 (Previously Presented): The electromechanical device of claim 18, wherein the plurality of queue execution modes includes at least a standard mode and a video mode.

Claim 26 (Previously Presented): The method of claim 1, wherein the plurality of queue execution modes includes at least a standard mode and a video mode.

Claim 27 (New): The electromechanical device of claim 18, wherein the electromechanical device receives instructions from a host device establishing the plurality of queue execution modes, wherein the instructions assign a unique set of tag values for each of the plurality of queue execution modes.

Claim 28 (New): The electromechanical device of claim 27, wherein the tag values assigned to queue execution modes are sector count register values.

Claim 29 (New): The electromechanical device of claim 18, wherein the controller is configured to execute the selected data access command according to the queue execution modes determined for the selected data access command.

Claim 30 (New): The method of claim 1, further comprising executing the data access command according to the queue execution modes associated the assigned unique tags.

Claim 31 (New): The method of claim 1, wherein a host device establishes the queue execution modes and informs a data storage device which set of tag values is assigned to each queue execution mode.

Claim 32 (New): The method of claim 1, wherein the tag values assigned to queue execution modes are sector count register values.

Claim 33 (New): A method comprising:

assigning a different unique tag to each of several data access commands; and  
for each of the data access commands, executing the data access command according to one of a plurality of queue execution modes, wherein the one of a plurality of queue execution modes is selected based on the data access command's unique tag.
